

Leather Laser Engraving Projects

Leather Laser Engraving Tips For You

Sculpfun laser engraver can engrave on genuine leather and artificial leather.

You can engrave logos, patterns and any other designs on the leather.

However, you should avoid faux leather made from PVC as it produces hydrochloric acid gas which can damage the lens of your laser engraver .

To cut leather you need a laser with a minimum power of 10W, lasers lower than that are not recommended. For example Sculpfun S10 can cut leather, but sculptfun s9 cannot cut leather.

Continuous laser exposure at one point in the leather can cause heat buildup and fire.

Engraving leather with a laser is much better than using some sharp tools.

When the laser beam burns the leather, the crevices and edges of the incision are filled with burn residue.

When the gaps are filled, fungal buildup in the leather is less likely and lasts longer.

Compared to other materials, leather can display your designs well in any color.

Even the laser engraving on the black leather is very pleasing and easy to spot.

HTPOW has cooperated with almost laser engraving and cutting machine brands and has become the world's largest supplier of home laser engraving machines.If you need to buy, you can go to HTPOW to buy the laser engraving machine you need.
